Low Fidelity

In this low-fi cart page prototype, I took some existing shopping cart patterns from online shopping websites. I chose to place the product image to be at the very left and then the product name at the top half and edits at the bottom half to the right of the product image. I think it makes sense to group the all edits (changing the glaze, the quantity, and remove) together. The price is shown at the very right of this region, which is a pattern that I'm seeing across various shopping cart pages.

High Fidelity

The glaze choice and quantity choice buttons on the product detail page will change color whenever it's being selected or the mouse hovers over to provide more feedback and feedforward. In the cart page, the layout is adapted from the lo-fi sketch above, but some minor details have been changed. There is now a 'total' amount at the end of the list of items in the cart so that users know how much in total they are spending before going into the final checkout process. Another change is the 'view detail' in the lo-fi is removed and incorporated into the product image and product name, which is another pattern I found with shopping cart pages.
